

INTRODUCING THE SYN-ONE TEST™ TO HELP DIAGNOSE PURE AUTONOMIC FAILURE

A convenient, evidence-based tool to support physicians and patients

Making a definitive diagnosis of pure autonomic failure (PAF) is often a complex undertaking for physicians. Patient history, symptoms, and other data can create a confusing array of diagnostic possibilities with no simple method for confirming a diagnosis.

That's why the founders of CND Life Sciences embarked on a mission to prove that pathologic evidence of phosphorylated synuclein (p-syn) can be reliably detected in cutaneous nerve fibers.

By analyzing three (3) small skin punch biopsies taken in your office, CND detects, visualizes, and quantifies the presence of p-syn in cutaneous nerve fibers—providing you with objective evidence to support a diagnosis and overall treatment plan.

Diagnose PAF with increased clarity and confidence

CLINICAL USE CASE EXAMPLES FOR PAF

- If you suspect PAF, but the patient does not have access to an autonomic expert who can confirm the diagnosis
- You have a patient who experiences unexplained orthostatic hypotension
- If you have a patient with autonomic failure and you are trying to determine if this is an autoimmune autonomic neuropathy or a synucleinopathy

SYN-ONE TEST ADVANTAGES:

High sensitivity and specificity for synucleinopathy

Minimally invasive

Provides visual proof of p-syn

Uses anatomical pathology codes covered by Medicare

Convenient and simple

Supports shared decision-making with patients
